I. Introduction

The first nuclear test, Trinity, exploded near Alamogordo, New Mexico, U.S.A., on 16 July 1945, marked the beginning of the nuclear explosive testing. Since then there is evidence that 2039 additional explosions have been conducted by seven countries (China, France, India, Pakistan, the Soviet Union, the United Kingdom, and the United States) during 1945-1998, according to information in the Nuclear Explosion Database at the Center for Monitoring Research (CMR) (Yang et al., 2000a; <http://www.pidc.org>). For completeness, the CMR database also includes the possible but disputed occurrence of an atmospheric nuclear explosion on 22 September 1979, with the "responsible country" listed as "Unknown". This paper summarizes information on worldwide nuclear explosions extracted from the CMR database.

The CMR Nuclear Explosion Database contains comprehensive data relevant to nuclear monitoring research (e.g. origin time, location, and yield) on nuclear explosions worldwide. To ensure the completeness of information, data have been collected from a variety of sources, ranging from government announcements to media reports. The database has been maintained and updated on a regular basis as new data became available and as errors have been corrected. In general, an event in the database has several “origins” (data on location, time of occurrence, and confidence bounds). A preferred origin for any given event has been selected based on the most complete and accurate information on the coordinates and time of each explosion. When possible, ground truth (GT) categories have been assigned to the data source to reflect the location accuracy. GTX refers to events with location accuracy better than X km (Yang et al., 2000b). While the accuracy of the origin time is also crucial information, at this time the focus is limited to location accuracy when defining GT events.

Table 1 gives the number of events by country in alphabetical order, and event locations are shown in Figure 1. The two nuclear weapons (5 August 1945; 9 August 1945) that the U.S. exploded over Japan are also included. Official listings are available for all explosions conducted by the United States (DOE/NV209, 1997; ‘NV209’), and for all nuclear explosions conducted by the Soviet Union (Mikhailov et al, 1996; ‘RFAE’). Partial listings of nuclear explosions are available from official publications of China (China Today, 1988; ‘CT’), France (CEA/DAM), and the United Kingdom (NV209). These listings confirm the nuclear nature of each listed event, and frequently the yield has also been given. However, except for shot times in the French list and the coordinates for six events in the U.S. list, they do not include origin times or event coordinates. Such data have been obtained for most events from other sources, official and

unofficial and of varying quality, as described in the following sections. In the absence of coordinates or time for a given event, nominal coordinates or an origin time of 00:00:00 were assigned (there are exceptions for USSR events on 6 June 1964, 8 October 1978, and 7 July 1987 whose announced or estimated origin times were 00:00:00).

Table 2 describes the data sources which were mentioned above, as well as others which were used in the event lists given in the Appendix. The preferred origins for all worldwide nuclear explosions in the CMR database are included in the Appendix. A list of selected highlights from each country's program is given in the printed version of this Volume.

II. US and UK nuclear explosions

The United States Department of Energy (NV209) listed all nuclear tests (including date, location name, yield range, and explosion type) conducted by the U.S.; these took place from July 1945 to September 1992. Among the 1056 events 24 are joint underground tests with the United Kingdom (US-UK) conducted in Nevada. Event coordinates were given for six events: Wigwam and Swordfish (underwater tests), and Yucca, Argus I, Argus II, and Argus III (high altitude and near-space tests). A recent revision of NV209 includes more complete information on US nuclear explosions. The new data will replace the current NV209 in the CMR database at a later date. The U.S. also provided official information on many tests for inclusion in Preliminary Determinations of Epicenters (PDE) or bulletins of the International Seismological Centre (ISC), including origin time and coordinates. This information is identified by authors AEC, ERDA or DOE.

Griggs and Press (1961; ‘G+P’), published authoritative data on times and coordinates of most U.S. tests through 1958. Springer and Kinnaman (1971; 1975; ‘SPRINGER’) published such information on time and coordinates for subsequent US or joint US-UK underground nuclear explosions through 1973. The accuracy of the origin information (latitude, longitude, time) for these later tests should be well within ± 0.1 km in location and ± 0.005 second in time. Other preferred data sources include Gutenberg and Richter (1946; ‘G+R’) for the Bikini Baker event, Gutenberg (1946) for the time of the Trinity event, and Johnson et al. (1981) for the Swordfish event.

Authoritative information on the 21 UK atmospheric tests has been published by the U.S. Department of Defense and Atomic Energy Commission (Glasstone, 1964), giving date, yield range, and location name. Peter Marshall of the UK Atomic Weapons Establishment has kindly provided confirmation of 18 of these, and also added name, height of burst and yield (‘BLACKNEST’). Along with the 24 joint US-UK underground tests given in NV209, the event list is believed to be complete for the UK nuclear explosions.

III. USSR nuclear explosions

The Ministries for Atomic Energy and for Defense of the Russian Federation (RFAE) released official information (including date, location name, yield range, and explosion type) on all USSR nuclear weapons tests and peaceful nuclear explosions (PNEs) that took place from 1949 through 1990. There are 715 tests in total. Bocharov et al. (1989; ‘BOCHAROV’) published authoritative information on time and coordinates for 96 underground USSR nuclear explosions at the Semipalatinsk Test Site. The accuracy of the origin information (latitude, longitude, time) for these tests should be well within ± 0.1 km in location and ± 0.05 second in time. Sultanov et al.

(1999; ‘SULTANOV’) provide a more diverse spectrum of data on Soviet PNEs (most are accurate to ± 1 km in location and ± 1 second in time, but some are accurate only on the order of 10-25 km). Other preferred data sources include Khristoforov (1996; ‘KHRISTOFOROV’) for seven underwater/near-surface explosions in Novaya Zemlya, AWE-JED (U.K. Atomic Weapons Establishment, 1994) and Richards (2000; ‘RICHARDS’) for other Novaya Zemlya events, Khalturin et al. (2000) for some small events in Semipalatinsk, and Murphy and Jenab (1992) for the USSR Joint Verification Experiment (JVE) event.

IV. French nuclear explosions

There is no authoritative source of location information for all of the French tests. The first four tests, conducted in the Sahara, were surface or tower shots reported only to be near Reggan (Glasstone, 1964). However, data on the 13 underground tests in the Sahara, as reported by Bolt (1976; ‘BOLT’), originally published by Duclaux and Michaud (1970) through the Academy of Science, Paris, almost certainly must be derived from authoritative sources.

An official list of French nuclear tests at the Pacific Test Center (CEA/DAM) gives information for 175 events in French Polynesia from 1966-1991, including date and time (accurate to the minute and in most cases to the second), event name, location name, test mode, and released nuclear energy range. Since that time six more probable tests have been conducted at that site. For the better recorded events at Mururoa, the origins obtained by author AWE-JED (U.K. Atomic Weapons Establishment, 1993) probably possess location accuracies of the order of ± 5 km.

V. Chinese, Indian, and Pakistani nuclear explosions

For the Chinese events there is no authoritative information on origin time and location. However, 32 of the 45 Chinese tests have been confirmed by an official publication of the Chinese government (China Today, 1988). For the Chinese tests in the CMR database, preferred data sources include AWE-JED (U.K. Atomic Weapons Establishment, 1993) and GUPTA-JED (Gupta, 1995). They are probably fairly accurate (at least on the order of ± 5 km in location), and the latter were referenced to locations based on satellite data. Two AWE-JED events (6 October 1983; 3 October 1984) may possess GT2 quality.

For the Indian and Pakistan explosions, satellite data analyses yielded locations accurate to ± 1 km or better (Gupta and Pabian, 1996; ‘GUPTA+PABIAN’; Barker et al., 1998; ‘BARKER’), except that the preferred origin for the 13 May 1998 is based on the news media.

VI. Summary and conclusions

We have listed information on all 2041 worldwide nuclear explosions (including one unknown/disputed event) conducted by seven countries, extracted from the CMR database. Until recently, none of the nuclear weapons states had published a complete list of accurate locations and origin times for all of the nuclear explosions it has carried out. But in December 2000, revision 15 of DOE NV209 was published that gives complete hypocentral information, including origin time, latitude, longitude, and depth, for all US and joint US-UK tests (http://www.nv.doe.gov/news&pubs/publications/historyreports/pdfs/DOENV209_REV15.pdf).

This information will replace the current NV209 in the CMR database at a later date.

All the 1032 events by the US are confirmed (‘NV209’) nuclear explosions. For the 45 events by the United Kingdom, 18 events are confirmed atmospheric nuclear explosions (‘BLACKNEST’),

24 events are confirmed underground nuclear explosions jointly with the US, and three others are given by Glasstone (1964). All the 715 events by the USSR are confirmed ('RFAE') nuclear explosions. For the 198 events by France, 175 are confirmed nuclear explosions at the Pacific Test Center between 1966 and 1991 ('CEA/DAM'), six additional recent events at that location have been recorded by the PIDC (Prototype International Data Center) between 1995 and 1996, and 17 events before July 1966 are probable nuclear explosions at test sites in the Sahara. For the 45 Chinese events, all 32 events between 1964 and 1984 are confirmed nuclear tests (China Today, 1988), and 13 probable nuclear tests on the Chinese test site have been detected seismically since 1984. Two Indian and Pakistan tests, respectively, have also been recorded by teleseismic stations.

We cannot guarantee that all events are actually nuclear explosions, or that our compilation of the nuclear explosion list is complete. Neither can we guarantee the accuracy of all of the descriptive information on these events, even though we believe the compilers of this information have taken great care. Given the volume of the data, the chance of some errors is high. Accordingly, it is ultimately the users' responsibility to assess the accuracy and completeness of the data, and to determine if they are sufficient for the users' intended purpose. Work to eliminate discrepancies and duplications, and to add new information as it becomes available, will continue.

VII. Acknowledgments

The following individuals contributed information/help to the CMR Nuclear Explosion Database: Spiro Spiliopoulos and Lesley Hodgson at the Australian Geological Survey Organization, Vladimir Belov and Yury Kraev at the Special Monitoring Service of the Ministry of Defense of the Russian Federation, Jannine Ford at the U.S. Department of Energy, Peter Marshall at the U.K. Atomic Weapons Establishment, B. Massinon at the Departement Analyse et Surveillance de l'Environnement in France, Jack Murphy at Maxwell Technology, Vitaly Khalturin at Lamont- Doherty Earth Observatory of Columbia University, NORSAR, and Hans Israelsson, Keith McLaughlin, Richard Stead, and Beth Turner at CMR. Victor Kirichenko at SAIC Moscow office and Peter Marshall at Blacknest have provided especially helpful reviews of this paper.

	Explosions, Maxwell, PL-TR-92-2076, SSS-TR-92-13129, 1992.	
NORSAR	CMR compiled data from NORSAR, Semiannual Technical Summary, 1 April-30 September 1998, NORSAR Sci Rep. No.1-98/99, 1998.	
NRDC	CMR compiled data from “Nuclear Weapons Databook” or “Nuclear Weapons Databook Working Papers” by the Natural Resource Defence Council, Washington, DC. Separate databooks report on U.S., Soviet, Chinese and French nuclear tests.	-
NV209	CMR compiled data from United States nuclear tests, July 1945 through September 1992, DOE/NV-209 (Rev. 14), March 1997.	GT2 (2 events)
PDE	CMR compiled data from monthly bulletins reporting “Preliminary Determinations of Epicenters”, from the U.S. Geological Survey, National Earthquake Information Center, or from predecessor organizations in the U.S. National Oceanic and Atmospheric Administration or in the U.S. Coast and Geodetic Survey. For U.S. explosions in 1964 and later, origins attributed to PDE are, in most cases, based on data released by DOE or its predecessor agencies, AEC and ERDA.	-
RFAE	CMR compiled data from Mikhailov, V.N. et al., USSR nuclear weapons tests and peaceful nuclear explosions, 1949 through 1990, RFNC- VNIIEF, 1996.	-
RICHARDS	CMR compiled data from Richards, P., Accurate estimates of the absolute location of underground nuclear tests at the northern Novaya Zemlya Test Site, Proceedings of Second Workshop on IMS Location Calibration, 10-24 March 2000, Oslo, Norway.	GT1/GT2
SPRINGER	CMR compiled data from Springer, D.L. and R.L. Kinnaman, Seismic Source Summary for U.S. Underground Nuclear Explosions, 1961-1970, Bull. Seism. Soc. Am., 61, 1073-1098, 1971, and Seismic Source Summary for U.S. Underground Nuclear Explosions, 1971-1973, Bull. Seism. Soc. Am., 65, 343-349, 1975.	GT0
SULTANOV	CMR compiled data from Sultanov, D.D., J.R. Murphy, and Kh.D. Rubbibstein, A seismic source summary for Soviet Peaceful Nuclear Explosions, Bull. Seism. Soc. Am., 89, 1999.	GT1/GT10/GT25
TCARTER	CMR compiled data from gleaned from newspaper accounts, books, magazines etc. by T.B. Carter.	-

GT*: GT categories. GTX refers to events with location accuracy better than X km (Yang et al., 2000b).

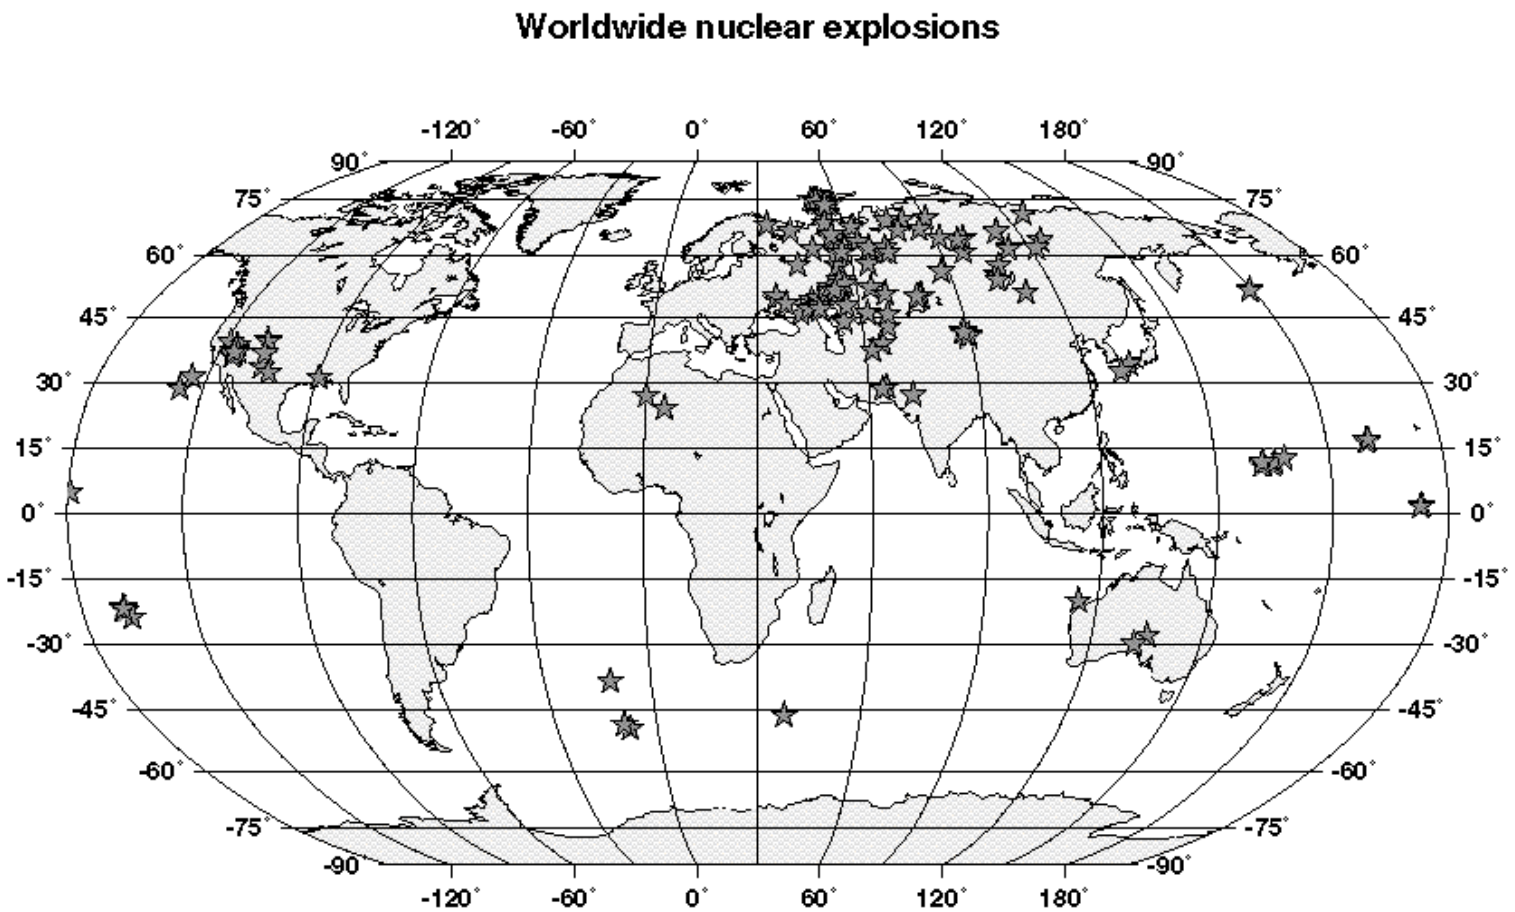

Figure 1. Locations for worldwide nuclear explosions in the CMR Nuclear Explosion Database.

Appendix: Event list of preferred origins

The preferred origins of all events in the CMR Nuclear Explosion Database are listed in this Appendix by country in an alphabetic order (Table 1), China, France, India, Pakistan, UK, USSR, US, and Unknown. The data format is time (GMT; month/day/year hour:minute:second), latitude (degree; north positive), longitude (degree; east positive), depth (km; downward positive), mb, yield (kt), maximum yield (kt), explosion code, event name, and preferred author.

The four-character explosion code used in this Appendix indicates the type and setting of the explosion: character 1 for type of explosion (N-nuclear); character 2 for air (A), water (W), or underground (U); character 3 for confirmed (C) or presumed (P); and character 4 for US (U), USSR (S), France (F), China (C), India (I), United Kingdom (G), or Pakistan (P). The five-character code is the same as the four-character code except that characters 4-5 indicate the joined countries: USA and UK. The ten-character code indicates multiple shots: e.g. NUCS_SALVO. The character '-' is used for unknown.

In conformity with treaties between the United States and the Soviet Union, a salvo is defined, for multiple explosions *for peaceful purposes*, as two or more separate explosions where a period of time between successive individual explosions does not exceed 5 seconds and where the burial points of all explosive devices can be connected by segments of straight lines, each of them connecting two burial points, and the total length does not exceed 40 kilometers. *For nuclear weapon tests*, a salvo is defined as two or more underground nuclear explosions conducted at a test site within an area delineated by a circle having a diameter of two kilometers and conducted within a total period of time of 0.1 second.

The event list combines information on magnitude and yield from several origins of each event. If there is no mb value for the preferred origin, the value listed is the maximum mb from all origins, whose mbs are obtained from networks with good azimuthal distributions (e.g. ISC, PDE). The yield information is taken from the official sources, NV209 for the US events, RFAE for the USSR events, CEA/DAM for the French events, and NV209 and BLACKNEST for the UK events. When there is no official source for an event, the yield and maximum yield are values from the preferred origin.

When both a yield and a maximum yield are listed, these values should be taken to mean a reported range in yield. For salvos, these values are sums of the values reported for each of the individual explosions.
